# Testing Methods

## Drop Count Tests

Drop Count Test Methods use an eyedropper or dropper bottles to quickly and accurately test your samples. The number of drops used for the indicator color change is multiplied by a factor to obtain the results. The dropper bottle tests are calibrated for 10 or 25 ml of sample.

## Color Match Tests

Color Match Test Methods utilize a block, slide, or card comparator to obtain the results of a colorimetric reaction. This test allows for quick yet accurate results without the need for expensive apparatus. Color matching are also qualitative tests where the sample color change indicates the presence of a chemical specie.

## Reagents & Powder Pillows

Replacement reagents for equipment calibration and test kit refills. Solutions, powders and powder pillows for titration and colorimetric tests.

## Electronic Testers

Colored products from particular chemical reactions can be accurately measured with an advanced microprocessor-controlled photometer. You can test other important water quality parameters using electronic testers such as pH, conductivity/TDS and ORP.
